#### Abstract

This research investigated the importance and priorities of the project overhead costs in Iraq via a questionnaire using the fuzzy analytic hierarchy process technique (FAHP). Using this technique is very important in the uncertain circumstances as in our country. The researcher reached to frame an equation through the results of the priorities of weights include the percentages of each of the main items of the project overhead costs. The researcher tested this equation by applying it to one of the completed projects and the results showed suitability for the application. The percentages of the (salaries, grants, and incentives) and (fieldwork requirements) in equation represent approximately two-thirds of project overhead costs. So the contractors should deal with the project overhead costs carefully during estimate the bid.

Keywords: project Overhead, Costs, FAHP, Construction Industry

## 1. INTRODUCTION

The costs of any construction project can be divided into three main parts, the direct costs, indirect costs (overhead costs) and the profit. Before starting any project, the construction costs

[^0]are planned, the exact costs will be known after the end of the project. Overhead costs are very important costs while estimating building, overhead costs increase continuously and do not decrease. Indirect cost or overhead costs of projects plays a large role and clear influence on the construction industry performance, Kumar, and Kumar, 2016.

## 2. OVERHEAD COSTS

Direct cost can be defined as the costs directly assignable to a particular product or process. Indirect costs or overhead costs can be defined as the costs not directly assignable to a specified cost object, Kumar, and Kumar, 2016.
Project overhead costs which are also called job site are all a part of the expenses which are spent by the contractors in managing a project at the site, Assaf, et al., 1999.

## 3. RESEARCH AIMS

The specific aims of this research are:

1. To identify prioritize the project overhead costs items during the costs estimation when pricing the bid.
2. To identify the best percentage of the project overhead costs which may be estimated when pricing the bid.
3. To conclude equations formulas for calculating the percentages of each project overhead costs items.

## 4. FUZZY ANALYTIC HIERARCHY PROCESS (FAHP)

One of the many useful ways of decision-making is a multi-criteria decision-making (MCDM) method. When testing the criteria in method of analytic hierarchy process (AHP), which play important role in selecting alternatives in addition to determine the weights, it uses understanding and knowledge without need to specific data but it deals with experts ratings by conventional numbers (crisp) ranging from 1 to 9 and it does not deal with the uncertainty of experts ratings. In order to overcome these shortages, the fuzzy logic was integrated with (AHP) method. The combination between (AHP) method and fuzzy logic gives greater flexibility in taking decisions and ratings. The fuzzy analytic hierarchy process (FAHP) reflects the human approach of thinking when dealing with approximate and uncertain information to make decisions. It also maintains the basic characteristics of (AHP) method, facilitates dealing with the quantitative and qualitative data, uses a hierarchical structure, pair comparisons, reduces conflict, and get weights ray, Ibrahim, et al., 2011.

## 5. STUDY METHODOLOGY

The following steps summaries the methodology of this study:

1. Perform the questionnaire containing the items of project overhead costs which have high or very high importance and neglect the items which get medium or less importance as was reached by Rashed and Al-Dhaheri, 2017, and performing the pairwise comparison matrix.
2. Distribution the questionnaire for nine experts who have more than 10 years in construction projects. Experience of the experts was in the site management, pricing the bid and engineering consulting offices in the private and public sector company to identify the relative importance for the items (every item with itself and others) from their perspective.

For application, the comparison pairwise between parameters has used the crisp numbers of Saaty scale in Table $\mathbf{1}$ to simplify the answer operation from experts.
3. Performing the calculations of (FAHP) algorithms for the experts' opinions to conclude the weight of every item. The researcher use excel program for the (FAHP) algorithm calculation and two for the consistency ratio to reach for the results.
4. Forming the equation terms from the weights for main and sub-items.
5. Applying the case study on the equation term of the main project items of the overhead costs.

## 6. FAHP ALGORITHM

The next step after listing and converting the pairwise comparison matrix for each expert to the fuzzy form using fuzzy numbers of Saaty scale in Table 1, and finding the integrated fuzzy comparison matrix for the experts group by using the geometric mean to obtain the final matrix, is to apply the extent of FAHP used in four steps, Chang, 1996, as follows:
$\mathrm{M}^{1}{ }_{\mathrm{gi}}, \mathrm{M}^{2}{ }_{\mathrm{gi}}, \mathrm{M}^{\mathrm{m}}{ }_{\mathrm{gi}}, \mathrm{i}=1,2, \ldots \ldots, \mathrm{n}$
Where, all of the $\mathrm{M}^{\mathrm{j}}{ }_{\mathrm{gi}}(\mathrm{j}=1,2, \ldots, \mathrm{~m})$ are TFNs.
Step 1: The value of a fuzzy synthetic extent with respect to the ith object is defined as:
$\mathrm{S}_{\mathrm{i}}=\Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} \mathrm{M}^{\mathrm{j}}{ }_{\mathrm{gi}} *\left[\Sigma^{\mathrm{n}}{ }_{\mathrm{i}=1} \Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} \mathrm{M}^{\mathrm{j}}{ }_{\mathrm{gi}}\right]^{-1}$
To obtain the $\Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} \mathrm{M}^{\mathrm{j}}{ }_{\mathrm{gi}}$, we perform the fuzzy addition operation of m extent analysis values for a particular matrix such that:
$\Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} \mathrm{M}^{\mathrm{j}}{ }_{\mathrm{gi}}=\left\{\Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} l j, \Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} m j, \Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} u j\right\}$
Obtaining the $\left[\Sigma^{\mathrm{n}}{ }_{\mathrm{i}=1} \Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} \mathrm{M}^{\mathrm{j}}{ }_{\mathrm{g} i}\right]$ we perform the fuzzy addition operation of $\mathrm{M}^{\mathrm{j}}{ }_{\mathrm{gi}}$
$(\mathrm{j}=1,2,3, \ldots \ldots \mathrm{~m})$ values such that
$\Sigma^{\mathrm{n}}{ }_{\mathrm{i}=1} \Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} \mathrm{M}^{\mathrm{j}}{ }_{\mathrm{gi}}=\left\{\Sigma^{\mathrm{m}}{ }_{\mathrm{i}=1} l \mathrm{i}, \Sigma^{\mathrm{m}}{ }_{\mathrm{i}=1} m \mathrm{i}, \Sigma^{\mathrm{m}}{ }_{\mathrm{i}=1} u \mathrm{i}\right\}$
Compute the inverse of the vector above, such that:
$\left[\Sigma^{\mathrm{n}}{ }_{\mathrm{i}=1} \Sigma^{\mathrm{m}}{ }_{\mathrm{j}=1} \mathrm{M}^{\mathrm{j}}{ }_{\mathrm{gi}}\right]^{-1}=\left\{{ }^{1} / \Sigma^{\mathrm{n}}{ }_{\mathrm{i}=1} u \mathrm{i},{ }^{1} / \Sigma^{\mathrm{n}}{ }_{\mathrm{i}=1} \mathrm{mi},{ }^{1} / \Sigma^{\mathrm{n}}{ }_{\mathrm{i}=1} \mathrm{li}\right\}$
Step2: As $\tilde{M} 1=\left(L_{1}, M_{1}, U_{1}\right)$ and $\tilde{M} 2=\left(L_{2}, M_{2}, U_{2}\right)$ are two TFNs, the degree of possibility of $M 2=\left(L_{1}, M_{1}, U_{1}\right) \geq M 1=\left(L_{2}, M_{2}, U_{2}\right)$ is defined as:

$$
\left.\begin{array}{l}
= \begin{cases}1, \text { if } m 1 \geq m 2 \\
0, \text { if } l 1 \geq u 2\end{cases} \\
\frac{l 1-u 2}{(m 2-u 2)-(m 1-l 1)}
\end{array}, \begin{array}{ll}
\text { otherwise }
\end{array}\right\} \begin{array}{ll}
1, \text { if } m 2 \geq m 1  \tag{6}\\
\frac{u 2-l 1}{(u 2-m 2)+(m 1-l 1)} & \text { if } l 1 \leq u 2
\end{array}
$$

## 0 , otherwise

Step3: The possibility degree for a convex fuzzy number to be greater than $k$ convex fuzzy numbers can be defined by:
$\mathrm{M}_{\mathrm{i}}(\mathrm{i}=1,2, \mathrm{k})$
$V\left(M \geq M_{1}, M_{2}, \ldots \ldots . M_{k}\right)=V\left[\left(M \geq M_{1}\right)\right.$ and $\left(M \geq M_{2}\right)$ and $\ldots \ldots .\left[\left(M \geq M_{k}\right)\right]=\min$
$\mathrm{V}\left(\mathrm{M} \geq \mathrm{M}_{\mathrm{i}}\right), \mathrm{i}=1,2,3, \ldots \mathrm{k}$
Assume that $\mathrm{d}\left(\mathrm{A}_{\mathrm{i}}\right)=\min \mathrm{V}\left(\mathrm{S}_{\mathrm{i}} \geq \mathrm{S}_{\mathrm{k}}\right)$ for $\mathrm{k}=1,2, \ldots \ldots, \mathrm{n}, \mathrm{k} \neq \mathrm{i}$, the weight vector is given by :
$W^{\prime}=\left(d^{\prime}(A 1),\left(d^{\prime}(A 2), \ldots \ldots .\left(d^{\prime}(A n)\right)^{\mathrm{T}}\right.\right.$
To compare M1 and M2, we need of both the values of V (M1 2 M 2$)$ and $\mathrm{V}(\mathrm{M} 2 \geq \mathrm{M} 1)$
Step4: the normalized weight vectors would be:
$W=\left(d\left(A_{1}\right),\left(d\left(A_{2}\right), \ldots \ldots .\left(d\left(A_{n}\right)\right)^{\mathrm{T}}\right.\right.$
Where W is a non-fuzzy number.

## 7. CALCULATION OF CONSISTENCY RATIO IN FAHP METHOD

The harmonic of the comparisons of every expert must be certain, to identify if the comparisons are harmonic or absonant to be certain of the consistency and validity of experts' answers, inconsistency ratio is calculated by using Gogus and Boucher method for this purpose.
This method showed in the steps below, Buckley, 1985.
Stage1: The integrated fuzzy triangular matrix is divided into two matrices of middle numbers and the geometric mean of upper and lower limits of triangular numbers.
Stage2: The weight vector of each matrix is calculated by Saaty method as following:

$$
\begin{align*}
& \mathrm{w}_{\mathrm{i}}^{\mathrm{m}}=1 / \mathrm{n}\left[\Sigma^{\mathrm{n}}{ }_{\mathrm{j}=1}\left(\mathrm{a}_{\mathrm{ijm}} / \Sigma^{\mathrm{n}}{ }_{\mathrm{i}=1} \mathrm{a}_{\mathrm{ijm}}\right)\right] \quad \text { that } \mathrm{w}^{\mathrm{m}}=\left[\mathrm{w}_{\mathrm{i}}^{\mathrm{m}}\right]  \tag{10}\\
& \mathrm{w}_{\mathrm{i}}^{\mathrm{g}}=1 / \mathrm{n}\left[\Sigma^{\mathrm{n}}{ }_{\mathrm{j}=1}\left\{\left(\mathrm{a}_{\mathrm{iju}} * \mathrm{a}_{\mathrm{ijl}}\right)^{1 / 2}\right\} /\left\{\Sigma^{\mathrm{n}}{ }_{\mathrm{i}=1}\left(\mathrm{a}_{\mathrm{iju}} * \mathrm{a}_{\mathrm{ijl}} l\right)^{1 / 2}\right\}\right] \quad \text { that } \mathrm{w}^{\mathrm{g}}=\left[\mathrm{w}_{\mathrm{i}} \mathrm{~g}\right] \tag{11}
\end{align*}
$$

Stage 3: The biggest eigenvalue for each matrix is calculated by the following equation:

$$
\begin{align*}
& \lambda^{m_{\max }}=1 / n\left[\Sigma^{n_{i=1}} \Sigma^{n_{j=1}} a_{i j m}\left(w_{j}^{m} / w_{i}^{m}\right)\right]  \tag{12}\\
& \lambda g_{\max }=1 / n\left[\Sigma^{n}{ }_{i=1} \Sigma^{n}{ }_{j=1}\left(a_{i j u} * a_{i j l}\right)^{1 / 2}\left(w_{j}{ }^{\mathrm{g}} / w_{i} \mathrm{~g}\right)\right] \tag{13}
\end{align*}
$$

Stage 4: Then, consistency index is computed by the following equation:

$$
\begin{align*}
& \mathrm{Cl}^{\mathrm{m}}=\left(\lambda \mathrm{m}_{\text {max }}-\mathrm{n}\right) /(\mathrm{n}-1)  \tag{14}\\
& \mathrm{Cl}^{\mathrm{g}}=\left(\boldsymbol{\lambda} \mathrm{g}_{\text {max }}-\mathrm{n}\right) /(\mathrm{n}-1) \tag{15}
\end{align*}
$$

Stage 5: Finally, to compute the consistency rate (CR), the CI index is divided by the random index (RI) as illustrated in Table 2. If the value is lower than 0.1, the matrix is consistent and validated.

## 8. CALCULATIONS RESULTS OF THE MAIN AND SUB ITEMS.

After integration experts' opinions by the geometric mean, the rest steps of FAHP algorithm applied to the integration results to finding the items weights as explained in the Tables 4 to 10. Example: The empirical example below shows the application of FAHP algorithm steps on the Sub Items of (POH) Related with Dispatch, Transportation \& Communication which showed in Table 8.

- Integrating the experts opinions by the geometric mean(G.M.):
G.M. for (DTC1- DTC2) $=\left\{(3,4,5)^{2} *(2,3,4)^{2} *(1,2,3)^{3} *(1,1,1) *(1 / 3,1 / 2,1)\right\}^{1 / 9}$
$=(1.318,2.0263,2.8065)$
G.M. for (DTC1-DTC3) $=\left\{(6,7,8) *(3,4,5) *(2,3,4) *(1,2,3)^{3} *(1,1,1)^{2} *(1 / 4,1 / 3,1 / 2)\right\}^{1 / 9}$
$=(1.2765,1.8245,2.3469)$
G.M. for (DTC2- DTC3) $=\left\{(6,7,8) *(3,4,5) *(2,3,4) *(1,2,3)^{2} *(1 / 3,1 / 2,1) *(1 / 4,1 / 3,1 / 2)^{3}\right\}^{1 / 9}$ $=(0.8303,1.2252,1.7807)$
G.M. for (DTC2- DTC1) $=$ Reverse (power of -1) for G.M. of $($ DTC1- DTC2 $)=$ $1 /(2.8065,2.0263,1.318)=(\mathbf{0 . 3 5 6 3}, \mathbf{0 . 4 9 3 5}, \mathbf{0 . 7 5 8 7})$
G.M. for (DTC3- DTC1) $=$ Reverse $($ power of -1) for G.M. of $($ DTC1- DTC3 $)=$ $1 /(2.3469,1.8245,1.2765)=(\mathbf{0 . 4 2 6 1}, \mathbf{0 . 5 4 8 1}, \mathbf{0 . 7 8 3 4})$
G.M. for (DTC3- DTC2) $=$ Reverse $($ power of -1$)$ for G.M. of $($ DTC2- DTC3 $)=$ $1 /(1.7807,1.2252,0.8303)=(\mathbf{0} .5616, \mathbf{0 . 8 1 6 2}, \mathbf{1 . 2 0 4 4})$

The result of integrated fuzzy comparison matrices (with geometric mean) are shown below:

|  | DTC1 |  |  | DTC2 |  |  | DTC3 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| DTC1 | 1 | 1 | 1 | 1.3180 | 2.0263 | 2.8065 | 1.2765 | 1.8245 | 2.3469 |
| DTC2 | 0.3563 | 0.4935 | 0.7587 | 1 | 1 | 1 | 0.8303 | 1.2252 | 1.7807 |
| DTC3 | 0.4261 | 0.5481 | 0.7834 | 0.5616 | 0.8162 | 1.2044 | 1 | 1 | 1 |

Step 1: Calculating ( Si ) by the following mathematical processes:
Finding the sum of each integrated row:
Sum of integrated rows for $\mathbf{D T C 1}=(1+1.3180+1.2765),(1+2.0263+1.8245),(1+2.8065+2.3469)$ $=(3.5945,4.8508,6.1534)$
Sum of integrated rows for DTC2 $=(0.3563+1+0.8303),(0.4935+1+1.2252),(0.7587+1+1.7807)$ $=(2.1866,2.7187,3.5394)$
Sum of integrated rows for DTC3 $=(0.4261+0.5616+1),(0.5481+0.8162+1),(0.7834+1.2044+1)$ $=(1.9877,2.3643,2.9878)$

The result of Collect each column of the results for the Sum of each integrated row above is: (7.7688, 9.9338, 12.6806)

The reverse (power of -1 ) for the collect of each column above is:
( $0.0789,0.1007,0.1287$ )
$\mathrm{S}_{\mathrm{i}}$ for $\mathrm{DTC1}=(\mathbf{0 . 2 8 3 5}, 0.4883,0.7921)$
$S_{\text {i for }}$ DTC2 $=(0.1724,0.2737,0.4556)$
$S_{i}$ for $D T C 3=(0.1567,0.2380,0.3846)$
Step2: Comparing $\mathrm{S}_{\mathrm{i}}$ with $\mathrm{S}_{\mathrm{k}}\left(\mathrm{V}\left(\mathrm{S}_{\mathrm{i}} \geq \mathrm{S}_{\mathrm{k}}\right)\right)$
-When compared $\mathrm{S}_{\mathrm{i}}$ for DTC1 with $\mathrm{S}_{\mathrm{i}}$ for DTC2 and $\mathrm{S}_{\mathrm{i}}$ for DTC3 find that ( $0.4883>0.2737$ ) so with $\mathrm{S}_{\mathrm{i}}$ for DTC3 find that $(0.4883>0.2380)$
This mean $V\left(S_{i} \geq S_{k}\right)$ for DTC1 $=(\mathbf{1 , 1})$
-When compared $\mathrm{S}_{\mathrm{i}}$ for DTC2 with $\mathrm{S}_{\mathrm{i}}$ for DTC1 find that ( $0.2737<0.4883$ ) $(0.2835<0.4556)$ then apply the third condition (0.4556-0.2835)/ [(0.4556-0.2737+(0.4883-0.2835)] $=\mathbf{0 . 4 4 5}$

When compared $\mathrm{S}_{\mathrm{i}}$ for DTC2 with $\mathrm{S}_{\mathrm{i}}$ for DTC3 find that $(0.2737>0.2380)$
This mean $V\left(S_{i} \geq S_{k}\right)$ for DTC2 $=(0.445,1)$
-When comparing $\mathrm{S}_{\mathrm{i}}$ for DTC3 with $\mathrm{S}_{\mathrm{i}}$ for DTC1, it was found that $(0.2380<0.4883)(0.2835<$ $0.3846)$ then applying the third condition ( $0.3846-0.2835) /[(0.3846-0.2380)+(0.4883-$ $0.2835)]=\mathbf{0 . 2 8 8}$
-When comparing $\mathrm{S}_{\mathrm{i}}$ for DTC3 with $\mathrm{S}_{\mathrm{i}}$ for DTC2, it was found that $(0.2380<0.2737)$ ( 0.1724 $<0.3846)$ then applying the third condition $(0.3846-0.1724) /[(0.3846-0.2380)+(0.2737-$ $0.1724)]=\mathbf{0 . 8 5 6}$
This means $V\left(S_{i} \geq S_{k}\right)$ for $D T C 2=(0.288,0.856)$
Step3: Finding the $\min \left(V\left(S_{i} \geq S_{k}\right)\right)$
The min value for $V\left(S_{i} \geq S_{k}\right)$ for DTC1 $=1$
The min value for $V\left(S_{i} \geq S_{k}\right)$ for DTC2= $\mathbf{0 . 4 4 5}$
The min value for $V\left(S_{i} \geq S_{k}\right)$ for DTC3= 0.288
Step4: Calculating the weights of each items
W for $\mathbf{D T C 1}=1 /(1+0.445+0.288)=1 / 1.733=\mathbf{0 . 5 7 7}$
W for DTC2 $=0.445 / 1.733=\mathbf{0 . 2 5 7}$
W for DTC2 $=0.288 / 1.733=\mathbf{0 . 1 6 6}$

- Finding the consistency ratio:

Stage1: The integrated fuzzy triangular matrix has been done in the example above:
Stage2: The weight vector of each matrix is calculated as below:

```
W}\mp@subsup{\mathbf{i}}{}{\mathbf{m}}=1/3*[(1/2.0416 +2.0263/3.8425+1.8245/4.0497),(0.4935/2.0416
1/3.8425+1.2252/4.0497), (0.5481/2.0416+0.8162/3.8425+1/4.0497)]=(0.4892,0.2682,0.2426)
Wi}\mp@subsup{}{\mathbf{g}}{}\mp@subsup{}{}{\mathbf{ }}=1/3*{[(1*1)/2.0977+(1.318*2.8065)/3.7457
(1.2765*2.3469)/3.9468),(0.3563*0.7587)/2.0977+(1*1)/3.7457
+ (0.8303*1.7807)/3.9468), (0.4261*0.7834)/2.0977+ (0.5616*1.2044)/3.7457+(1*1)/3.9468)]
=(0.4762, 0.2743, 0.2495)
```

Stage 3: The biggest eigenvalue for each matrix is calculated as below: $\lambda^{m_{\text {max }}}=1 / 3\{[(1 * 0.4892)+(2.0263 * 0.2682)+(1.8245 * 0.2426)] / 0.4892$, $[(0.4935 * 0.4892)+(1 * 0.2682)+(1.2252 * 0.2426)] / 0.2682,[(0.5481 * 0.4892)$
$+(0.8162 * 0.2682)+(1 * 0.2426)] / 0.2426\}=\mathbf{3 . 0 1 0 6}$
$\lambda \mathrm{g}_{\text {max }}=1 / 3\left\{\left[(1 * 1) 1 / 2 * 0.4762+(1.318 * 2.8065) 1 / 2 * 0.2743+(1.2765 * 2.3469)^{1 / 2 *} 0.2495\right] /\right.$
$0.4762,\left[(0.3563 * 0.7587)^{1 / 2 *} 0.4762+(1 * 1)^{1 / 2} * 0.2743+(0.8303 * 1.7807)^{1 / 2} * 0.2495\right] / 0.2743$,
$\left.\left[(0.4261 * 0.7834)^{1 / 2} * 0.4762+\left(0.5616^{*} 1.2044\right)^{1 / 2 *} 0.2743+(1 * 1)^{1 / 2} * 0.2495\right] / 0.2495\right\}=\mathbf{3 . 0 1 0 1}$

Stage 4: Computing the consistency index as below:
$\mathbf{C I}^{\mathbf{m}}=(3.0106-3) / 2=\mathbf{0 . 0 0 5 3} \quad \mathbf{C I}^{\mathbf{g}}=(3.0101-3) / 2=\mathbf{0 . 0 0 5 0}$
Stage 5: Compute the consistency ratio as below:
$\mathbf{C R}^{\mathbf{m}}=0.0053 / 0.4890=\mathbf{0 . 0 1 0 8} \quad \mathbf{C R}^{\mathrm{g}}=0.0050 / 0.1796=\mathbf{0 . 0 2 8 0}$
As illustrated in Table3, the consistency ratio of all main and sub-items of the POH costs are less than ( $10 \%$ ). This means that the experts judgments are valid and consistence.

## 9. THE CONCLUDED EQUATIONS FROM WEIGHTS OF THE SUB AND MAIN ITEMS OF THE (POH) COSTS

1. The concluded equation form weights of the Main Items of the $(\mathrm{POH})$ Costs, which showed in Table 4.
$\mathrm{POH}=\mathrm{SGI}+\mathrm{FWR}+\mathrm{SR}+\mathrm{DTC}+\mathrm{TWS}+\mathrm{POR}$
Where:
$\begin{array}{lll}\mathrm{SGI}=(0.338) \mathrm{POH} & \mathrm{FWR}=(0.311) \mathrm{POH} & \mathrm{SR}=(0.094) \mathrm{POH} \\ \mathrm{DTC}=(0.083) \mathrm{POH} & \mathrm{TWS}=(0.137) \mathrm{POH} & \mathrm{POR}=(0.037) \mathrm{POH}\end{array}$
2. The concluded equation form weights of the sub-items of $(\mathrm{POH})$ related to salaries, grants, and incentives which showed in Table 5.

SGI $=$ SGI1 + SGI2 + SGI3 + SGI4 + SGI8 + SGI9
Where:
SGI1 $=(0.366)$ SGI $\quad$ SGI2 $=(0.215)$ SGI $\quad$ SGI3 $=$ (0.279) SGI
SGI4 $=(0.115)$ SGI $\quad \mathrm{SGI} 8=(0.003) \mathrm{SGI} \quad \mathrm{SGI}=(0.022) \mathrm{SGI}$
3. The concluded equation form weights of the Sub-Items of $(\mathrm{POH})$ Related with Field Work Requirements which is shown in Table 6.
$\mathrm{FWR}=\mathrm{FWR} 1+\mathrm{FWR} 2+\mathrm{FWR} 3$
Where:
$\mathrm{FWR} 1=(0.640) \mathrm{FWR} \quad \mathrm{FWR} 2=(0.279) \mathrm{FWR} \quad \mathrm{FWR} 3=(0.081)$
4. The concluded equation form weights of the Sub-Items of $(\mathrm{POH})$ Related with Security Requirements which is shown in Table 7.
$\mathrm{SR}=\mathrm{SR} 1$
5. The concluded equation form weights of the Sub-Items of $(\mathrm{POH})$ Related with Dispatch, Transportation \& Communication which is shown in Table 8.
$\mathrm{DTC}=\mathrm{DTC} 1+\mathrm{DTC} 2+\mathrm{DTC} 3$
Where: $\mathrm{DTC} 1=(0.577)$ DTC

$$
\begin{equation*}
\mathrm{DTC} 2=(0.257) \mathrm{DTC} \quad \mathrm{DTC} 3=(0.166) \mathrm{DTC} \tag{20}
\end{equation*}
$$

6. The concluded equation form weights of the Sub-Items of $(\mathrm{POH})$ Related with Temporary Works at the site which is shown in Table 9.

TWS = TWS $1+$ TWS2 + TWS $3+$ TWS 4
Where:
TWS1 $=(\mathbf{0 . 2 7 8})$ TWS $\quad$ TWS2 $=(0.374)$ TWS

## 10. APPLYING THE CONCLUDED EQUATIONS ON A PROJECT AS CASE STUDY.

The concluded equation of main items of ( POH ) costs applied on (Haditha diesel power station) project, which is implemented by the General Company for Projects Design and Implementation - Iraqi Ministry of Industry and Minerals. The implementation period was (18) months and the full cost was (14,124,633,843 IQD) as shown in Table 11.
Table 11 shows that the percentages of [(salaries, grants, and incentives), (fieldwork requirements), and (project office requirements)] costs in the equation equal or close to a large extent to its actual percentages in the project. While there are no actual costs of [(security requirements) and (temporary works at the site)], and the percentage of the actual costs of (dispatch, transportation, and communications) very large comparative with its percentage in the equation.
Some of the company's specialists mentioned that there was a camp for accommodation and a restaurant in this project, but the caravans often transfer from project to other, while the other costs such as food etc. consider as (dispatch, transportation, and communications) for the project employees. The security requirements were covered by the client, which it is the Ministry of Electricity.

## 11. CONCLUSIONS

- The two main items of POH most important were the (salaries, grants, and incentives), (field work requirements) formed about two-thirds of the POH costs.
- The two sub-items most effect related with the first main item are (salaries of supervision \& project management) and the (salaries of mechanical and electrical engineers) formed more than two-thirds from the sum of (salaries, grants, and incentives).
- The sub-item most effect related with the second main item is (electric generators and required fuel) where formed about two-thirds from the sum of (fieldwork requirements).
- The fuzzy analytic hierarchy process technique (FAHP) helps in decision-making, analysis and assessment of the factors and identifying the priorities weights in more accurate way because it is suitable for uncertain circumstances.
- The expenses of dispatch, transportation in the project of the case study were nearly equal to the costs of salaries, grants, and incentives.

## 12. THE RECOMMENDATIONS

- Adopting the concluded equation of main items to estimate the POH cost during pricing the bids.
- Take into Consideration the importance ranks and the percentages of the concluded equations of sub items.
- Adopting the new management techniques like the (FAHP) technique as multi-criteria decision-making technique (MCDM ) in testing the criteria in Iraq because of its taking the uncertain and fussy conditions which plagued it in the consideration.
- The contractors should deal with the project overhead costs carefully during estimating the bid.
